# Factors Associated With Prolonged Viral RNA Shedding in Patients with Coronavirus Disease 2019 (COVID-19)

Retrospective study on risk factors associated with severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) RNA shedding were evaluated in a cohort of **113 symptomatic patients** from 2 hospitals outside Wuhan. The median duration of SARS-CoV-2 RNA detection was **17 (IQR 13–22) days** as measured from illness onset.

# PCR Assays Turned Positive in 25 Discharged COVID-19 Patients

The study population included 172 discharged COVID-19 patients from Jan 23<sup>th</sup> 2020 to Feb 21<sup>th</sup> 2020.

These were **25 of discharged patients (total 14.5%)** sent to hospital again because of the **positive RT-PCR results on virus again**.

These 25 patients experienced **an average of 7.32±3.86 days** from their last negative RT-PCR result **to turning positive again**.

Characteristics	Mean days (SD)
Length of first hospital stay	15.36 (3.81)
Antiviral treatment duration	13.44 (4.08)
Time from negative PCR test to discharge	2.71 (1.88)
Time from last negative to positive again	7.32 (3.86)

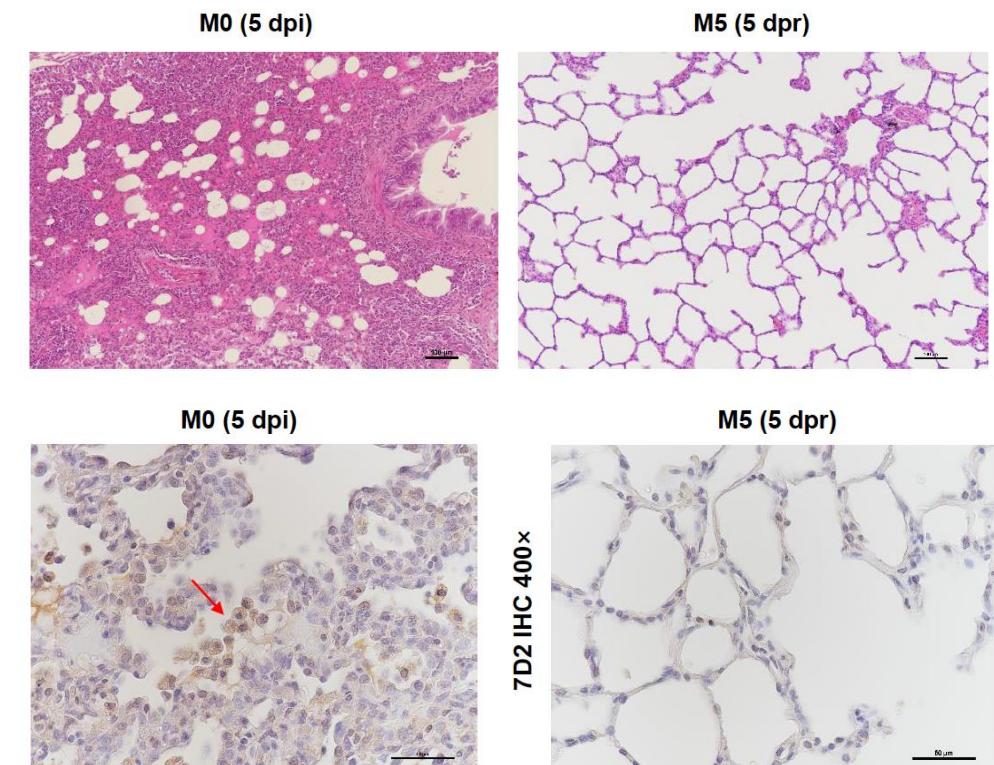

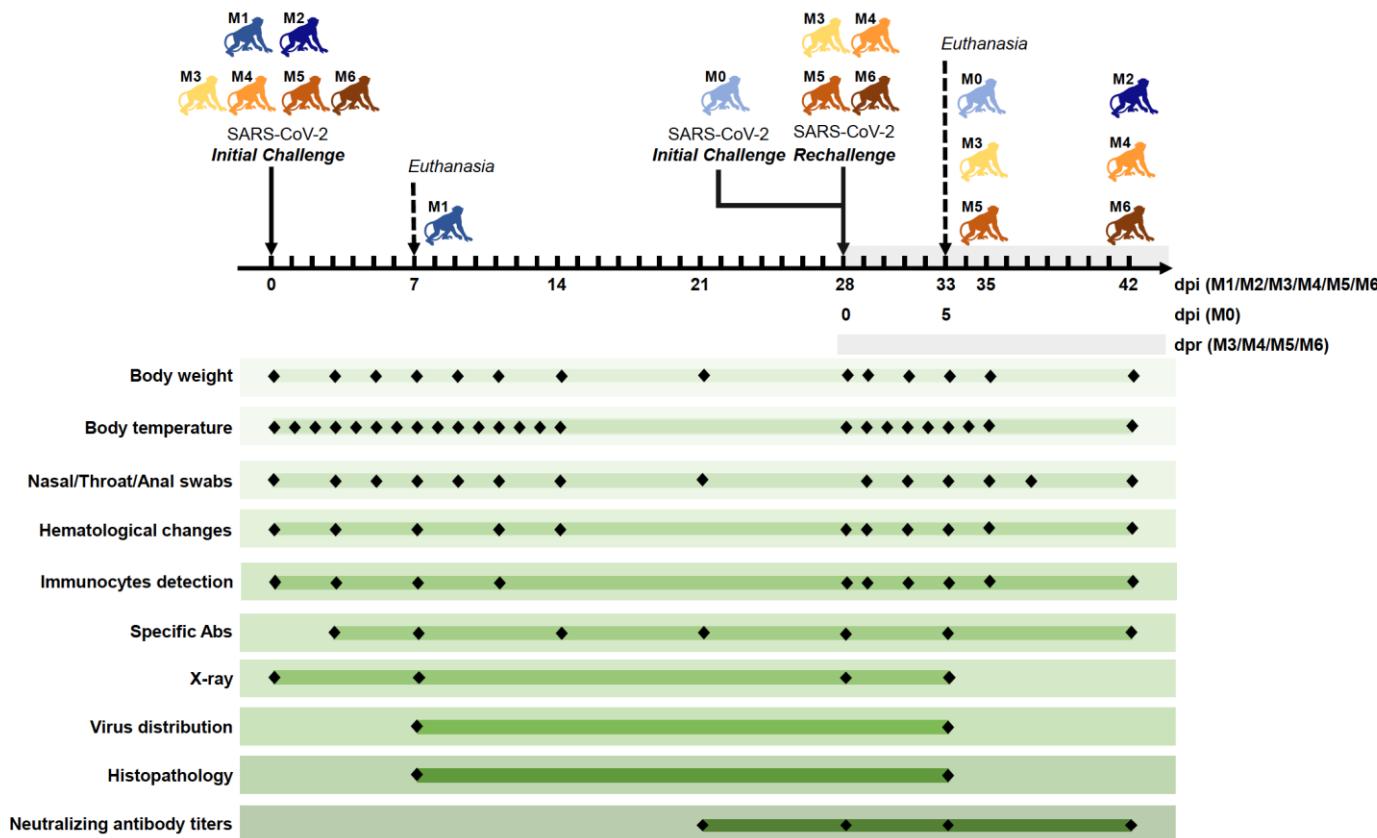

# False-negative of RT-PCR and prolonged nucleic acid conversion in COVID-19: Rather than recurrence

Variables	All Patients (N=70)	Non-consecutive false-negative (n=55)	Consecutive false-negative (n=15)	p-value
Age, median (IQR), years	57 (44-65)	57 (43-65)	64 (51-73)	0.093
Gender, Male, n (%)	31 (44.3%)	22 (40.0%)	9 (60.0%)	0.172
Severity on admission				0.935
Moderate	66 (94.3%)	52 (94.5%)	14 (93.3%)	
Severe	4 (5.7%)	3 (5.5%)	1 (6.7%)	
Onset of symptom to nucleic acid conversion, median (IQR), d	22 (19-32)	21 (18-26)	36 (28-40)	<0.001

We found that 15/70 (21.4%) patients experienced a “turn positive” of nucleic acid detection by RT-PCR test for SARS-CoV-2 after two consecutive negative results, which may be related to the false negative of RT-PCR test and prolonged nucleic acid conversion.

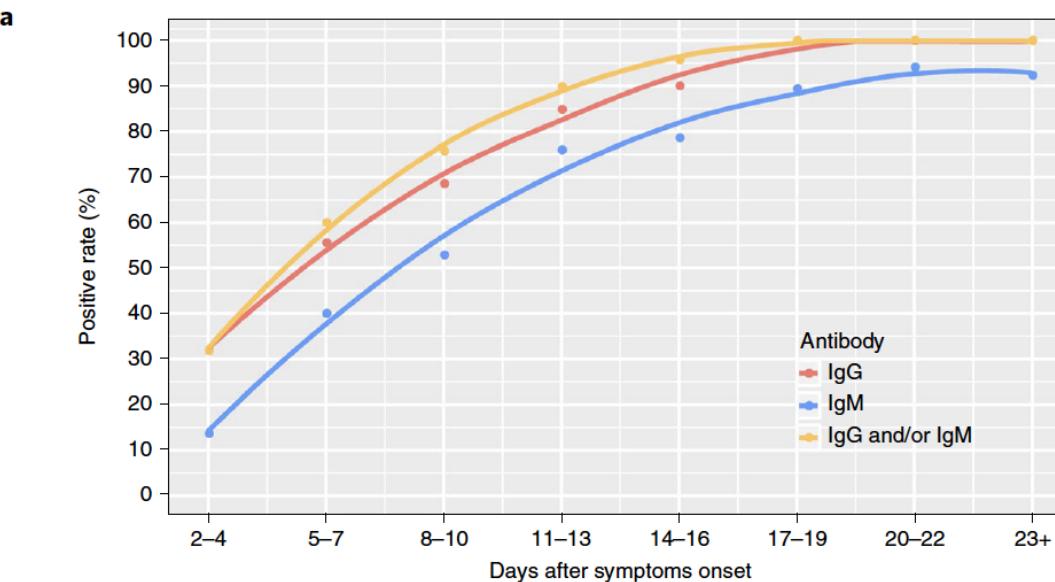

# Lack of Reinfection in Rhesus Macaques Infected with SARS-CoV-2

Rhesus macaques were rechallenged with SARS-CoV-2 during an early recovery phase from initial infection. The monkeys **rechallenged with the identical SARS-CoV-2 strain have failed to produce detectable viral dissemination**, clinical manifestations and histopathological changes. A notably **enhanced neutralizing antibody response** might contribute the protection of rhesus macaques from the reinfection by SARS-CoV-2. Our results indicated that **primary SARS-CoV-2 infection protects from subsequent reinfection**.

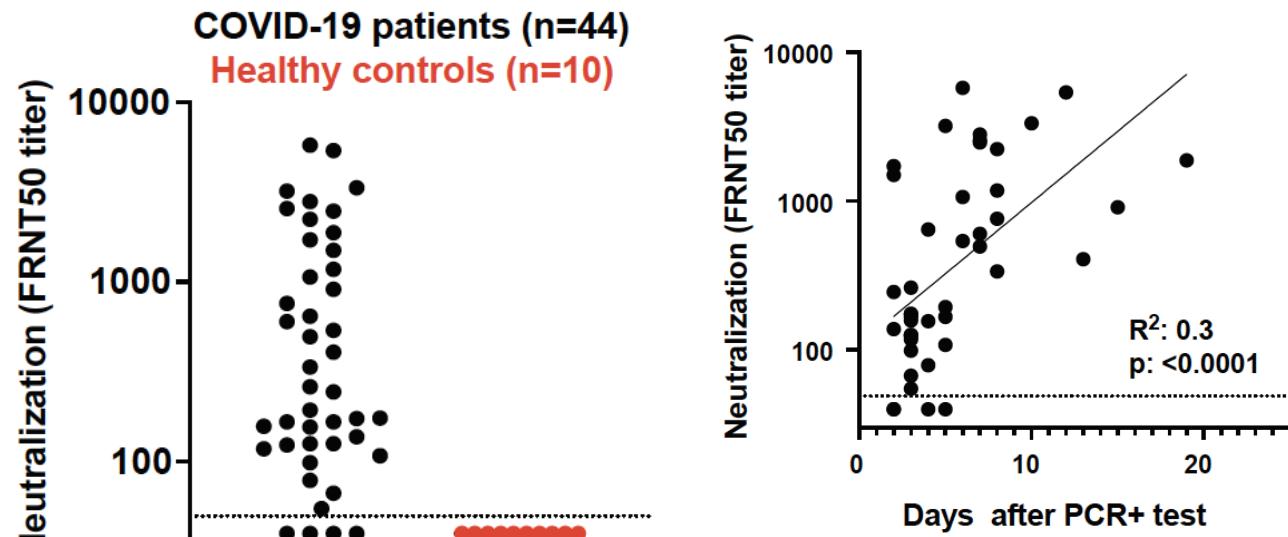

# Antibody response and neutralizing activity to SARS-CoV-2 in patients with COVID-19

Acute antibody responses to SARS-CoV-2 in 285 patients with COVID-19. Within 19 days after symptom onset, **100% of patients tested positive for antiviral immunoglobulin-G (IgG)**. Seroconversion for IgG and IgM occurred simultaneously or sequentially. Both IgG and IgM titers plateaued within 6 days after seroconversion.

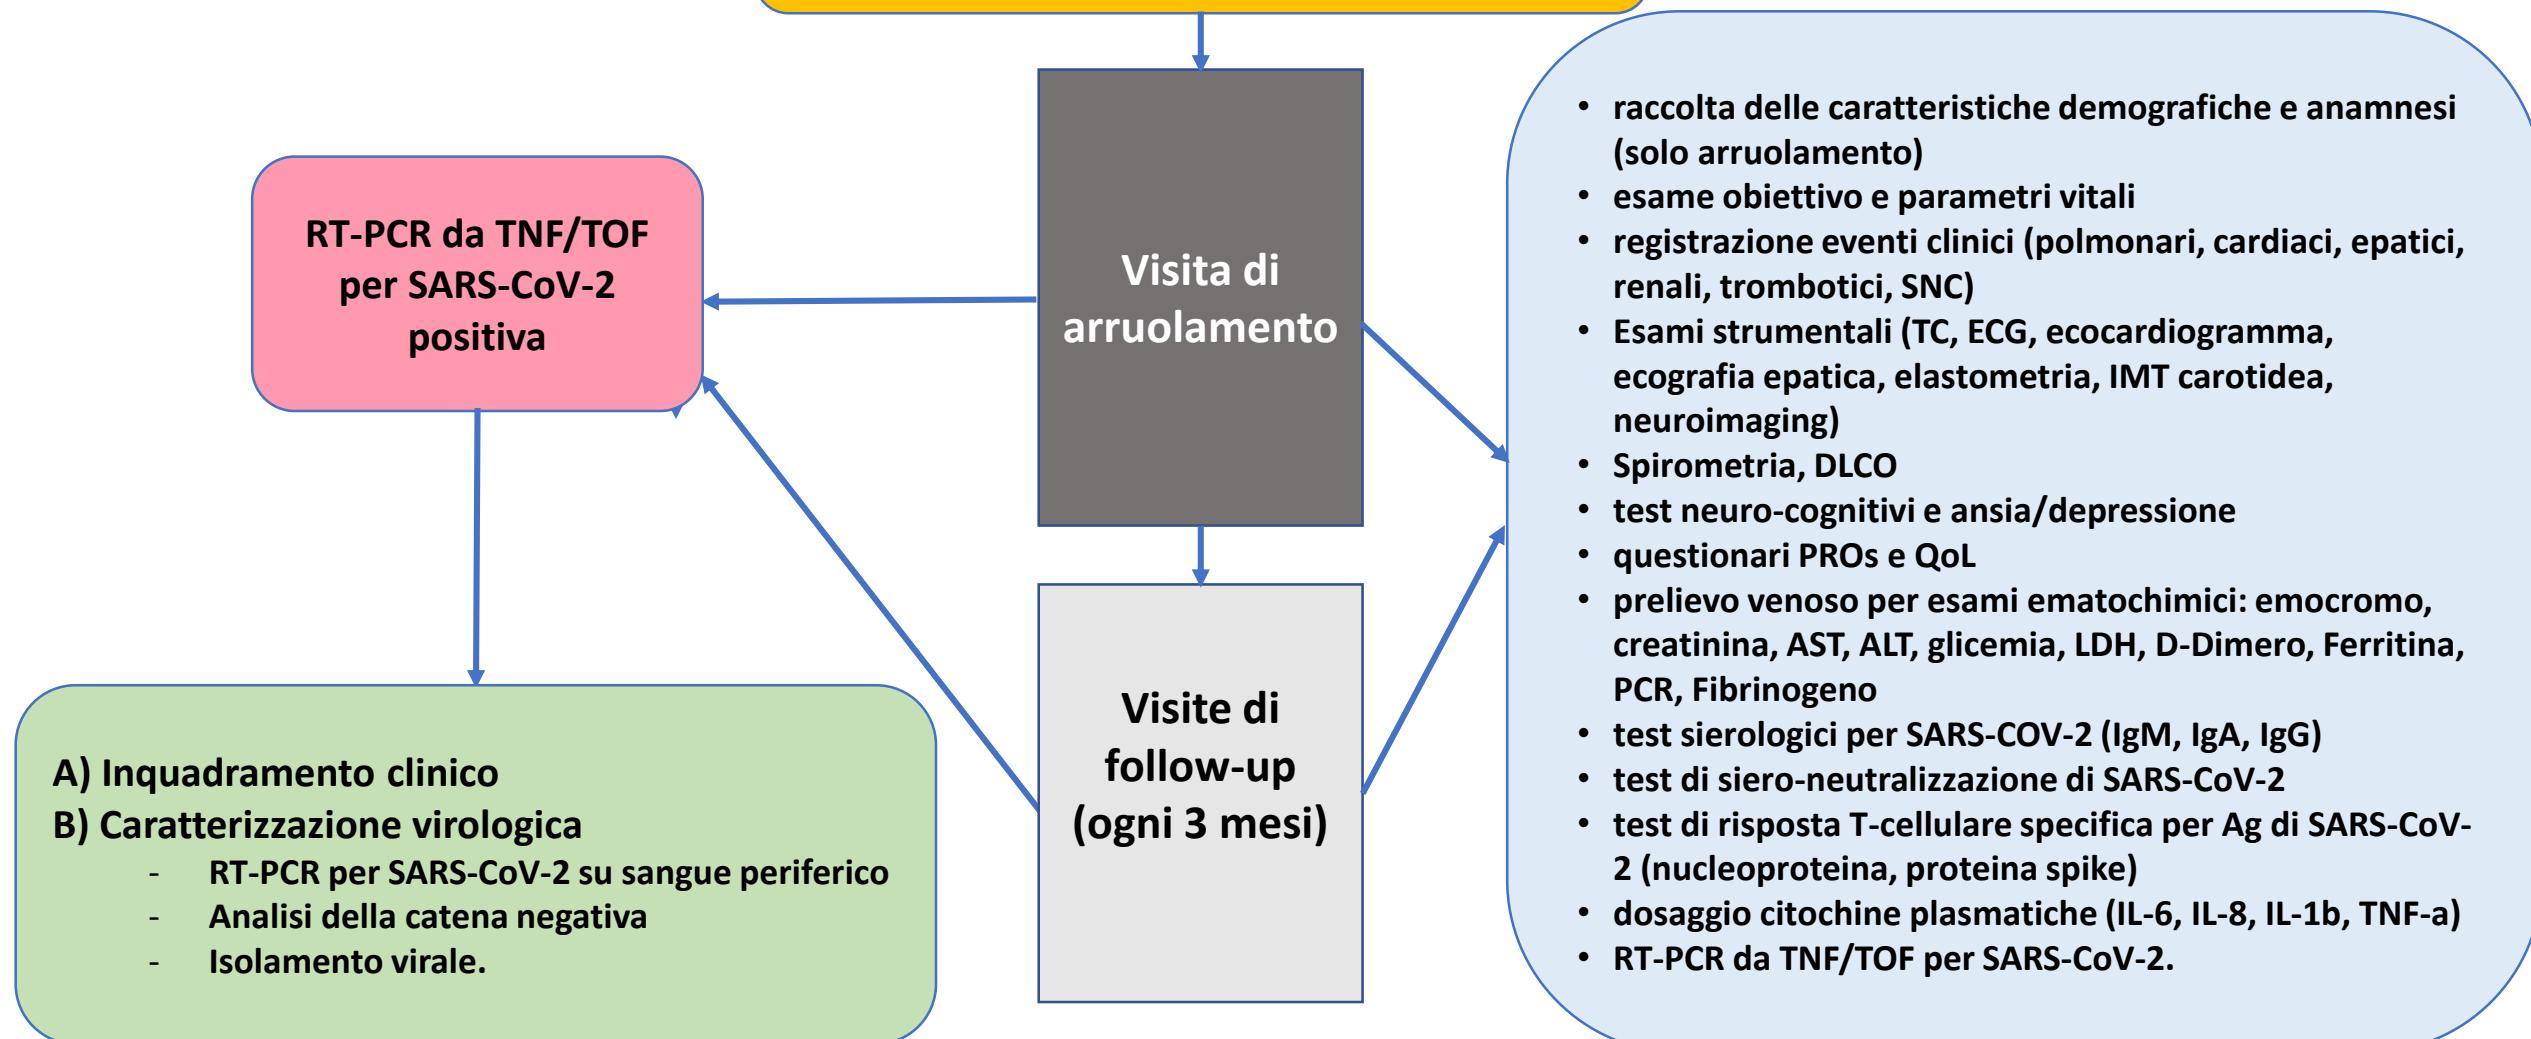

Long QX, et al. Nat Med. 2020 Apr 29. doi:  
10.1038/s41591-020-0897-1. [Epub ahead of print]

RBD-specific IgG responses were detectable **in all patients 6 days after PCR confirmation**. Using a clinical isolate of SARS-CoV-2, **neutralizing antibody titers** were also detectable in all patients **6 days after PCR confirmation**. The **magnitude of RBD-specific IgG binding titers correlated strongly with viral neutralization**.

Suthar MS, et al. medRxiv preprint doi:  
<https://doi.org/10.1101/2020.05.03.20084442>.

## PAZIENTI CON COVID-19 CON GUARIGIONE CLINICA\* E VIROLOGICA\*\*

\*Guarigione clinica=almeno 2 settimane dalla remissione dei sintomi; stato clinico=asintomatici

\*\*Guarigione viologica=2 TNF/TOF a distanza di 24 ore negativi al test RT-PCR per SARS-CoV-2.
